

Update on the app and requirements

Munangiwa Gift Lithole

The previous app code contained a bug in the `bivariate_explorer` function. On line 728, the code incorrectly used `with sidebar` instead of `with st.sidebar`. I have corrected this issue, so the app should now run without problems.

To run the application, the following packages must be installed:

- pandas
- numpy
- matplotlib
- seaborn
- scipy
- streamlit
- scikit-learn
- streamlit-option-menu

You can install all required packages using the provided `requirements.txt` file by running the following command in the terminal:

```
pip install -r requirements.txt
```

To launch the application, run the following command in the terminal:

```
streamlit run app.py
```
